

AGENT BEHAVIOUR POLICIES

Zoom in and you find the business logic

The first rules for an agent are mechanical. A few layers in, you are writing how the company works.

The first rules are mechanical. Vendors do them well.

Do not send, only draft. Do not delete. Use your own account. The same in every company.

Above the mechanics, every layer is the business

Each layer has its own owner, from IT and security up to the board.

Software used to enforce the rules by omission

Through a screen

- No invoice button until approval
- Your role hid payment details

Through an API

- The agent calls the same endpoint
- The hidden rule goes unenforced

No vendor can model every customer's business

The mechanical layer is a product. The business layers are the customer's, and the customer has to write them.

5 of 17

rules backed by a control

Six more rest on an accepted risk and six on hope. The firm is fictional; the shape is the point.

Where a vendor's control plugs in

Send gateway: a new recipient needs a person

Content check: never quote a price

Ledger check: invoice approved first

Legal's blocked list: the dispute rule

“

A skill says how. A policy layer says what is allowed, who owns the rule, and what stands in the way of breaking it.

FROM THE ARTICLE

Only the business can write its business logic

Write it in layers, each with an owner, and count what is enforced.
