

AGENTS AND LONG SESSIONS

Re-anchoring: keep an agent's rules alive

A rule given only in conversation can vanish when a session is summarised. Keep it in a file that comes back.

1.7%

**of the context kept, on average,
per summary**

Eighteen automatic summaries in a month, in the session that runs this site. Nothing said what was kept.

A conversation-only rule must win every summary

It often will. When it does not, nothing tells you.

The rules come back from disk

It keeps rules in view; it does not enforce them.

Three ways a rule fails, three fixes

Forgets it: re-anchoring

Cannot see the violation: a second reader

Argues an exception: a gate

One policy file, three jobs

- 1 Memory: printed back after every summary
- 2 Rulebook for an independent checker
- 3 Enforcement list: each rule's barrier

Add a canary that shows the policy was read

A short report, computed from the transcript, ends every few answers. Like the brown M&M test: if it is missing, check everything.

“

A policy row with a number next to it is a different thing from a policy row on its own.

ON MEASURING A RULE IN THE REPORT

Keep the rules in a file that comes back

Then watch for the report that shows it did. The recipe changes with every release.
